RE: Site Management Activity Complete at A.G. Anderson - HMMD Site # 89-0440 in Waterbury

Dear Mr. Anderson:

The Vermont Department of Environmental Conservation, Sites Management Section (SMS), has received and reviewed the third quarter report prepared by Lincoln Applied Geology for the above referenced site. Based on the information contained in the report, the SMS has concluded the following:

- Releases from the underground storage tank removed from this site on August 5, 1994 was the apparent source of the dissolved petroleum contaminants identified at this site.
- The degree and extent of these releases has been adequately defined.
- Levels of petroleum contaminants in the groundwater at this site are declining, and no petroleum contaminants have been identified off the compliance boundaries of this site in concentrations exceeding the Vermont groundwater enforcement standards within the last two years.
- Levels of non-petroleum contaminants in the groundwater at this site (which are not attributable to releases originating at this site), are very low and declining.
- No unacceptable threat to the human health or the environment exists at this site resulting from these releases.

Based on the results of this investigation, the site is eligible for a Site Management Activity Completed (SMAC) designation. Sites which the Hazardous Materials Management Division have determined require no further management are classified as SMAC. This designation does not release the A. G. Anderson Company from any past or future liability which may arise from the petroleum contamination which originated from the leaking underground storage tank system at this site. It does mean that the SMS is not requiring that any additional work be performed at this site in response to the initial contamination measured on the property. Please feel free to contact myself or Bob Haslam with any further questions or comments you may have.

Sincerely,

Chuck Schwer, Acting Chief
Sites Management Section
